Printed in Australia by ALAN LAW, Commonwealth Government Printer, Canberra

AUSTRALIAN STANDARD GEOGRAPHICAL CLASSIFICATION (ASGC)

ASGC AMENDMENT ADVICE NO. 2.1(2)

This Amendment Advice contains ASGC updating instructions, together with new and replacement pages to be included in ASGC Edition 2.1.

Each issue of replacement pages, covered by a particular Amendment Advice, creates, in effect, a new edition of the ASGC, which is identified by an edition number and the effective date of replacement pages. Appendix 1 specifies the content (and effective date) of each edition, while Appendix 2 specifies the spatial unit changes between editions.

This set of pages will update ASGC edition 2.1 to edition 2.3 status. It should be noted that ASGC edition 2.2 (effective 1 July 1992) replacement pages were not issued separately but are included as part of ASGC edition 2.3. Spatial unit changes between editions 2.1 and 2.2, and editions 2.2 and 2.3 can be referenced in Appendix 2.

The complete replacement of chapters 1 - 6 will allow that part of edition 2.1 of the ASGC to be kept intact for easy reference to the spatial units and codes used in the 1991 Census of Population and Housing.

UPDATING INSTRUCTIONS

Remove existing pages	Insert replacement/new pages	Remove existing pages	Insert replacement/new pages
Title page iii - vi	Title page iii - vi	<u>APPENDIX 3:</u>	
<u>CHAPTERS 1 - 6:</u>		-	3 - 6
1 - 242	1 - 126	<u>APPENDIX 4:</u>	
<u>APPENDIX 1:</u>			
1	1 - 6		
<u>APPENDIX 2:</u>			
-	43 - 53		

NOTE: It is advisable to retain the removed pages for future reference (eg under cover of this sheet in the back of the ASGC manual) for a few years.

The reason: ABS statistical publications are likely to quote the relevant ASGC edition used which can vary between publications and will vary over time. Accordingly, there may be occasions when users may wish to refer to ASGC pages relevant to previous editions.

PREFACE

The Australian Standard Geographical Classification (ASGC) has been prepared by the Australian Bureau of Statistics (ABS) for use in the collection, compilation and publication of its statistics. The ABS encourages other organisations to use this Classification in their own statistical work in order to improve the comparability and usefulness of statistics generally.

The ASGC was first published in 1985. This original ASGC was kept up-to-date by the issue of replacement pages, generally once or twice a year on an 'as needed' basis. The last issue of replacement pages in that series was Edition 9.

Following a major review of statistical geography which was completed in 1990, a revised ASGC was issued to contain details of spatial units and codes used for the collection and publication of data for the 1991 Census of Population and Housing. This revised ASGC, Edition 2.1, was to be used as the base copy to incorporate replacement pages for the following ASGC editions.

However, as a result of a change in the design of the manual, Chapters 1-6 of Edition 2.3 are presented as a complete replacement. This also has the advantage that it allows Edition 2.1 to be kept intact and provides ready access to the codes and spatial units used for the 1991 Census of Population and Housing. It should be noted that replacement pages to update Edition 2.1 to 2.2 were not issued but all changes are included in this edition and details can be referenced in Appendix 2.

A major feature of Edition 2.3 is the inclusion of the external territories of Cocos (Keeling) Islands, and Christmas Island within the scope of the ASGC. Together with Jervis Bay Territory, which was previously included with the Australian Capital Territory, they have been grouped under Other Territories. The statistical treatment of these territories is outlined in Chapter 1.14.

Any inquiries about the Classification, or suggestions for changes, should be directed to the Assistant Director, Area Classification, ABS, P.O. Box 10, BELCONNEN, ACT 2616.

ABBREVIATIONS

The following abbreviations are used in this Manual:

Spatial Unit Type

CD	— Census Collection District
Legal LGA	— Legal Local Government Area
MSR	— Major Statistical Region
S/T	— State/Territory
SD	— Statistical Division
S Dist.	— Statistical District
SLA	— Statistical Local Area
SR	— Statistical Region
SRS	— Statistical Region Sector
SSD	— Statistical Subdivision
UC/L	— Urban Centre/Locality

Legal LGA Type

(B)	— Borough
(C)	— City
(CGC)	— Community Government Council
(DC)	— District Council
(M)	— Municipality
(S)	— Shire
(RC)	— Rural City
(T)	— Town

States/Territories

NSW	— New South Wales
VIC	— Victoria
QLD	— Queensland
SA	— South Australia
WA	— Western Australia
TAS	— Tasmania
NT	— Northern Territory
ACT	— Australian Capital Territory
OT	— Other Territories

Miscellaneous

BSD	— Brisbane Statistical Division
Pt	— Part
Res.	— Reservoir

CHAPTER 1 : NATURE, PURPOSE AND PRINCIPLES OF THE CLASSIFICATION

Nature of the Classification

The ASGC is a system for the classification of statistical units by geographical areas.

2. Common types of statistical units so classified are households in population censuses and surveys, and establishment locations (eg individual farms, mines, factories and shops) in economic censuses and surveys. Once these units have been classified by assigning ASGC codes, statistics collected about them can be compiled and published (subject to normal confidentiality restraints) for ASGC geographical areas.
3. Each geographical area (or spatial unit) in the classification (such as the Adelaide Statistical Division) constitutes a particular 'category' of the classification, and all spatial units of a particular type which together cover a defined area (eg all Statistical Divisions in Australia) constitute a particular 'hierarchic level' of the classification.

Purpose and Principles of the Classification

4. The main purpose of the ASGC is to enable spatially classified statistics to be produced on a useful and comparable basis, in a cost effective manner.
5. In order to serve this purpose a geographical classification such as the ASGC should satisfy a number of requirements or principles. These provide that:
 - (a) the categories (or spatial units) of the classification must be useful, ie represent geographical areas for which statistical information is required by users of statistics;
 - (b) the categories within each hierarchic level of the classification must be —
 - of a particular defined type,
 - clearly delimited with precisely drawn boundaries,
 - uniquely identified by codes and names, and
 - mutually exclusive and jointly exhaustive of the total area covered by the hierarchic level;
 - (c) all the hierarchic levels which constitute a particular classification structure must —
 - cover the same defined geographical area (eg 'Australia' in the case of all the hierarchic levels of the Main structure of the ASGC, or all the incorporated areas of Australia in the case of all the hierarchic levels of the Legal LGA structure of the ASGC), and
 - form a chain of linked levels in which the categories in adjoining levels relate to each other by aggregation or disaggregation (ie in the sense that each broader level spatial unit must be coextensive with one or more lower level spatial units), and

(d) all the structures of an integrated multi-structured classification must link up at one or more of their levels, ie share a common set of categories at these levels.

6. The ASGC has been constructed in accordance with these principles as described below.

7. With regard to the first of these principles, ie usefulness, it is worth noting that the categories (or spatial units) now incorporated in the ASGC were used by the ABS for many years prior to the construction of the ASGC. Their usefulness was well established over those years and has also been reconfirmed by two user surveys. The first survey was conducted in 1982 and inquired into statistical user needs for spatial units. The second was conducted in 1988 and reviewed the existing spatial units and their delimitation criteria.

8. Apart from confirming a strong user demand for the types of spatial unit now incorporated in the ASGC, the main findings of the surveys indicated —

- a demand for a facility that permits existing statistics to be produced for a variety of different, customer-specified, spatial units,
- a need for stability in spatial unit boundaries over time (especially in the case of Census Collection Districts and Statistical Local Areas), and
- a need to improve the delimitation of some particular spatial units, eg to make some of them more homogeneous in terms of land use or urban and rural characteristics.

9. The first two needs identified in the preceding paragraph cannot be met quickly or cheaply. The first suggests the development of a costly positional geocoding system which would permit statistics to be assembled automatically for any user-defined area having a geographically referenced boundary. The second suggests the possible need to introduce a new type of spatial unit, such as the Australian Map Grid square, which would remain stable over time. This arises because the existing ASGC spatial units, being tied to changing LGA boundaries and physical features, are inherently unstable over time. Accordingly, further consideration needs to be given to these issues.

10. The need to improve the delimitation of particular ASGC spatial units has been accepted as a general aim and was addressed in the Review of Statistical Geography in 1988. It will continue to be addressed in periodic and ad hoc reviews of ASGC spatial units which will be undertaken within the context of ongoing ASGC maintenance.

11. In view of the strong user demand for the present ASGC spatial units, it is considered that they satisfy the first principle, usefulness, listed in paragraph 5(a) in spite of their relative lack of stability over time. The fact that the ASGC does not yet incorporate all the spatial units and facilities desired by users does not affect the validity of the present ASGC categories nor does it inhibit the incorporation of new spatial unit types to the ASGC if justified in terms of user needs.

12. The other principles outlined in paragraph 5 are all concerned with the architecture and specification of the classification and have been rigorously observed in the construction of the ASGC. As a result, the ASGC facilitates efficient coding, compilation and publication of geographically classified statistics on a spatially comparable basis.

Definition of Australia

13. For ASGC purposes, the ABS uses the definition of Australia as set out in Section 17(a) of the *Acts Interpretation Act 1901 – 1973* (Cwlth) as amended. This defines 'Australia' or the 'Commonwealth' as meaning 'the Commonwealth of Australia and, when used in a geographical sense, includes the Territory of Christmas Island and the Territory of Cocos (Keeling) Islands, but does not include any other external Territory'.

14. The States and Territories of Australia which are presently within the scope of the ASGC are New South Wales, Victoria, Queensland, South Australia, Western Australia, Tasmania, Northern Territory, Australian Capital Territory, Jervis Bay Territory, Territory of Christmas Island and Territory of Cocos (Keeling) Islands.

15. Prior to 1 July 1993, the external territories of Australia were not within the scope of the ASGC, although the Territories of Christmas Island and Cocos (Keeling) Islands have been within the scope of the Census of Population and Housing since the 1986 Census. However following the recent incorporation of the Indian Ocean territories into geographic Australia, these two territories have been included in the ASGC, effective from 1 July 1993. Other external territories remain excluded from statistical counts for Australia in accordance with international statistical standards.

16. In addition, the treatment of Jervis Bay Territory in the ASGC has been changed. Previously, because of its relative insignificance compared with other States/Territories and the consequent confidentiality of many series, and also because of its past administrative association with the Australian Capital Territory, Jervis Bay Territory has been included with the Australian Capital Territory for statistical purposes. From 1 July 1993 Jervis Bay Territory forms part of an 'Other Territories' category, along with the Territory of Christmas Island and the Territory of Cocos (Keeling) Islands.

17. Although included as part of the ASGC, all three of these territories are, for the present, regarded as out-of-scope for ABS censuses and surveys with the exception of the Census of Population and Housing and population estimates.

Order of the States/Territories

18. The order that has been adopted in the ASGC is one which has been widely used as a standard for very many years not only in the ABS but in other organizations that have been guided by ABS practice. That order is as follows:

State	Code	State/Territory	Code
NSW	1	TAS	6
VIC	2	NT	7
QLD	3	ACT	8
SA	4	OTHER TERRITORIES	9
WA	5		

The ordering of States and Territories was reviewed several years ago when Western Australia displaced South Australia as the fourth most populous State. The Commonwealth Table of Precedence adopted a revised protocol listing, such that any textual material having protocol significance should list Western Australia before South Australia. For the ASGC

however, and hence in statistical tables based on the ASGC, the order as shown above will continue to be followed. Maintaining this order will ensure historical continuity, reduce the possibility of errors in handling and interpreting data, and avoid additional costs associated with changing data processing systems.

The ASGC in ABS Statistical Geography

19. The ASGC is the principal classification used by the ABS and other organisations for the compilation and provision of geographically classified statistics.

20. The statistics produced by the ABS according to the ASGC are not all classified at the most detailed, ie the Census Collection District, level of the ASGC — that level is used almost exclusively for Population Census statistics. Other statistics, including most economic data, are generally classified at the Statistical Local Area level. Most economic statistics would generally be confidential at the Census Collection District level, particularly if cross-classified by industry and other characteristics. This means that generally only Population Census statistics can be produced for all ASGC structures for all of their hierarchic levels. Most other statistics can, at best, only be provided according to the 'Main', 'Legal LGA', 'Statistical District' or 'Statistical Region' structures of the ASGC down to the Statistical Local Area level, with confidentiality and other considerations permitting.

21. Another important aspect of the ASGC is that it cannot incorporate all the spatial unit types for which geographically classified statistics are required by users. The ABS uses numerous other geographical classifications and individual spatial units for the provision of statistics. The spatial unit types covered by these other classifications divide into two broad classes as follows:

- (a) ABS defined spatial unit types which have been devised for use in a particular State or Territory and which are relevant only to that State or Territory. Such spatial unit types have been excluded from the ASGC because they are relevant only to a particular State or Territory and have not been formulated in accordance with standard Australia-wide spatial unit definitions.
- (b) Non-ABS spatial unit types, other than Legal LGAs and States/Territories, which have been adopted for use by the ABS for the dissemination of statistics. These cannot, in general, be exactly aligned with any configuration of ASGC spatial units. This fact and/or their special purpose nature in many cases precludes them from incorporation in the ASGC. Examples of spatial unit types in this class are—

- Postcode Areas
- Commonwealth Electoral Divisions
- State Electoral Divisions
- Victorian Parishes and Counties
- South Australian Hundreds and Counties

- New South Wales Health Regions
- Queensland Rainfall Stations and Regions
- Australian Map Grid Squares in Western Australia.

22. The extent to which the spatial units in the ASGC can be linked and aggregated to equal or approximate spatial units in the other types of geographical classifications, mentioned in (a) and (b) above, varies considerably as illustrated by the following examples—

- Postcode Areas can only be approximated by aggregations of ASGC Census Collection Districts.
- Victorian Parishes cannot be represented, with any acceptable degree of approximation, by aggregations of any ASGC spatial units.

23. This means that dual or multiple geographical coding must be undertaken by the ABS where the statistics are required to be produced not only according to the ASGC, but also according to other geographical classifications and spatial units.

CHAPTER 2 : STRUCTURE OF THE CLASSIFICATION

Structures of the ASGC

The ASGC has been developed as a multi-structured hierarchic classification. This means that it is a classification in which the spatial units at the lower levels of the classification (eg Census Collection Districts or CDs) are aggregated upwards in several parallel streams into larger and larger spatial units at progressively higher hierarchic levels of the classification.

2. The spatial unit structure descriptions indicate that the ASGC comprises more than one hierarchy of units. For example, in one hierarchy CDs aggregate to Statistical Local Areas (SLAs) which aggregate to Statistical Subdivisions (SSDs) etc, and in another, CDs aggregate to SLAs which aggregate to Statistical Region Sectors (SRSs) etc. The seven hierarchic structures comprising the ASGC are shown in the following table (for abbreviations see page vi).

<i>ASGC Structure</i>	<i>Hierarchic levels</i>	<i>Total area</i>
Main	5 CDs, SLAs, SSDs, SDs, S/Ts	Australia
Statistical District	4 CDs, SLAs, SSDs, S Dists	Part of Australia
Legal LGA	4 CDs, SLAs, Legal LGAs, S/Ts(a)	Part of Australia
Statistical Region	6 CDs, SLAs, SRSs, SRs, MSRs, S/Ts	Australia
Urban Centre/Locality	2 CDs, UC/Ls	Part of Australia
Section of State	3 CDs, Sections of State, S/Ts	Australia

(a) Incorporated areas only.

3. The ASGC Structural Chart on page 7 depicts the ASGC in its entirety in terms of all its various structures, all the hierarchic levels in them and the relationships between them. Each of these structures is described in more detail in the following paragraphs.

4. In practice, the number of levels in the structures varies over time. This is because Census Collection Districts are defined only for those times at which a Census of Population and Housing is held. Accordingly, full ASGC structures can only exist at those times. At all other times the structures omit the Census Collection District level. These, and other 'in practice' variations (such as the inclusion in population census related ASGC editions only, of the Section of State and the Urban Centre/Locality structures), will be reflected in individual ASGC Manual editions which will present the structures relevant at that time.

ASGC STRUCTURAL CHART

NOTES/SYMBOLS

(a) The incorporated part of Australia.

(b) The part of Australia covered by all Statistical Districts.

(c) The part of Australia covered by all Urban Centres/Localities.

= means equality between adjoining levels.

↔ means that the spatial units in adjoining hierarchic levels are related to each other by aggregation or disaggregation.

Main Structure

5. The complete Main structure of the ASGC is depicted in paragraph 11 below. In this structure Census Collection Districts (CDs), the smallest spatial units in the ASGC, collectively cover all of Australia and add, without gaps or overlaps, to Statistical Local Areas. Collectively, these cover the same geographical area and add, without gaps or overlaps, to Statistical Subdivisions. Similar relationships apply to the remainder of the hierarchy, ie between Statistical Subdivisions and Statistical Divisions and between Statistical Divisions and States/Territories.
6. Census Collection Districts are defined only for those times at which a Census of Population and Housing is held. Accordingly, the full Main structure can only exist at those times. At all other times the Main structure of the ASGC consists of the top four hierarchic levels, ie the Statistical Local Areas, Statistical Subdivisions, Statistical Divisions and States/Territories. This situation will be reflected in the ASGC Manual which will present the Main structure relevant at that time. The current Main structure of the ASGC down to the Statistical Local Area level is set out in the Detailed Main structure in Chapter 6 of this Manual. In population census related ASGC editions, the Census Collection District level of this structure can be obtained from the separate Census Collection District listing, also in Chapter 6.
7. Statistical Local Areas (SLAs) consist of one or more CDs at the time when CDs are current — at all other times SLAs are, in effect, the smallest spatial unit in the ASGC. They can be local government areas, or parts thereof, or any unincorporated area. They cover, in aggregate, the whole of Australia without gaps or overlaps. They are used, in general, as the smallest type of spatial unit for the geographic classification of establishment locations and for the compilation and publication of economic, social and demographic statistics other than those collected in population censuses.
8. Statistical Subdivisions (SSDs) consist of one or more SLAs and cover, in aggregate, the whole of Australia without gaps or overlaps. They are used as intermediate level, general purpose, regional type spatial units.
9. Statistical Divisions (SDs) consist of one or more SSDs and cover, in aggregate, the whole of Australia without gaps or overlaps. They are used as large, general purpose, regional type spatial units.
10. States and Territories (S/Ts) in most cases consist of two or more SDs, and cover the whole of Australia (as defined for statistical purposes) without gaps or overlaps. They encompass the geographic areas of the Australian States, mainland Territories (including Jervis Bay Territory) and the Indian Ocean Territories of Christmas Island and Cocos (Keeling) Islands.
11. The complete Main structure of the ASGC can be depicted as follows:

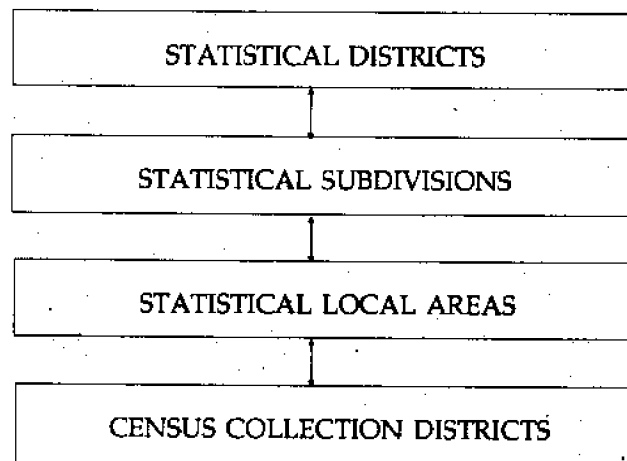

In this structure the spatial units in adjoining levels are related to each other by aggregation or disaggregation and within each level, cover all of Australia.

Statistical District Structure

12. Statistical Districts represent the more important, predominantly urban areas of Australia which are not contained wholly within one Legal LGA or within a capital city SD. Because of their nature they can and, in some cases, do straddle Statistical Division and State/Territory boundaries. An example is the 'Gold Coast-Tweed' Statistical District which encompasses an urban area which lies partly in the State of Queensland and partly in the State of New South Wales. For this reason and the fact that the total area covered by Statistical Districts relates only to part of Australia, they cannot be incorporated in the Main structure.

13. Each Statistical District in the ASGC consists of either one or more Statistical Subdivisions as illustrated in the Statistical District structure in Chapter 6. Each of these Subdivisions consists of Statistical Local Areas which, in turn, consist of Census Collection Districts at population census times.

14. The complete Statistical District structure of the ASGC can be depicted as follows:

In this structure the Census Collection Districts and higher level spatial units are confined to those which fall within Statistical Districts and relate to each other by aggregation or disaggregation as shown above.

15. Although this structure consists of the four hierarchic levels depicted above, only the spatial units in the top three levels are normally used for the presentation of statistics according to the Statistical District structure. The current Statistical District structure of the ASGC down to Statistical Local Area level is set out in the Statistical District structure in Chapter 6 of this Manual. In population census related ASGC editions the Census Collection District level of this structure can be obtained from the separate Census Collection District listing, also in Chapter 6.

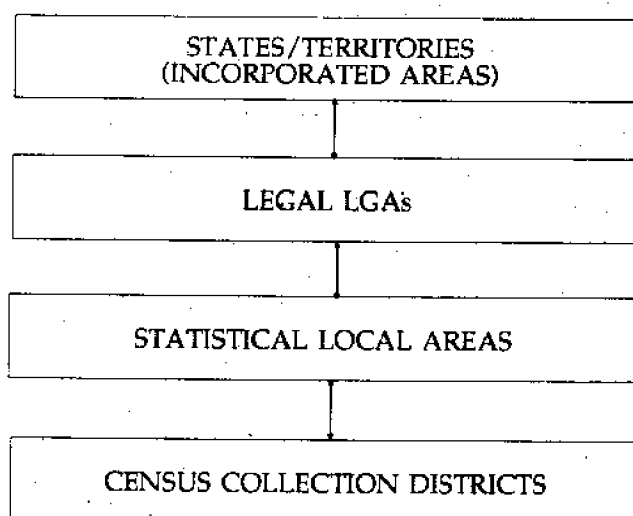

Legal Local Government Area Structure

16. Each Legal Local Government Area (Legal LGA) in the ASGC represents the whole, undivided geographical area of responsibility of an incorporated Local Government Council or an incorporated Community Government Council which has been determined to be of sufficient size and significance to warrant recognition as a separate Legal LGA. Legal LGAs cannot be included in the Main structure for two reasons:

- (a) some (eg Albert Shire in Queensland) have boundaries that cut across Statistical Subdivisions and Statistical Divisions thereby preventing them from being fitted into the Main structure; and
- (b) the total area covered by them relates only to a part of Australia, whereas the total area covered by the Main structure categories relates to the whole of Australia.

17. Each Legal LGA in the ASGC consists of one or more particular Statistical Local Areas which, in turn, consist of Census Collection Districts at population census times. Legal LGAs can be aggregated to State/Territory totals although the areas represented by these totals only cover the 'incorporated' parts of the State/Territory concerned.

18. The complete Legal LGA structure of the ASGC can be depicted as follows:

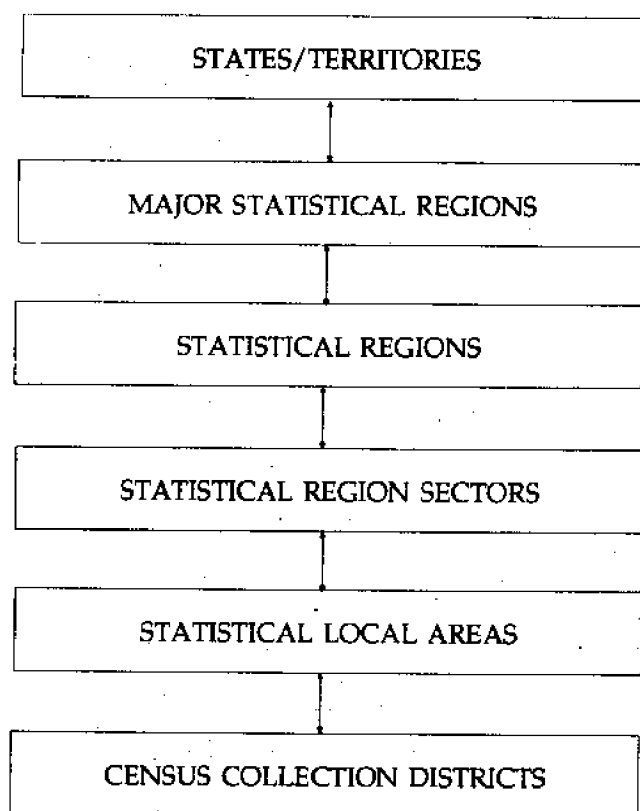

In this structure the Census Collection Districts and the Statistical Local Areas are confined to those which fall within Legal LGAs and relate to each other by aggregation and disaggregation.

19. Although this structure consists of the four hierarchic levels depicted above, only the spatial units in the top two or three levels would normally be used for the presentation of statistics according to the Legal LGA structure. The current Legal LGA structure of the ASGC down to the Statistical Local Area level is set out, in detail, in the Alphabetic List of Legal LGAs and Statistical Local Areas within States/Territories in Chapter 6 of this Manual. In population census related ASGC editions the Census Collection District (CD) level of this structure can be obtained from the separate Census Collection District listing, also in Chapter 6.

Statistical Region Structure

20. The Statistical Region (SR) structure has been used since 1986 primarily for the production of standard statistical outputs from population censuses and labour force surveys. The Statistical Regions in this structure equate, in some cases, with Statistical Subdivisions and, in others, with parts or aggregations of Statistical Subdivisions or Divisions and cannot therefore be incorporated in the Main structure of the ASGC.

21. The complete Statistical Region structure consists of six hierarchic levels as follows:

In this structure the spatial units in adjoining levels are related to each other by aggregation and disaggregation and, within each level, cover all of Australia.

22. Although this structure consists of the six hierarchic levels depicted above, only the spatial units in the top five levels would normally be used for the presentation of statistics according to the Statistical Region structure. The current Statistical Region structure of the ASGC down to the Statistical Local Area level is set out in the Detailed Statistical Region structure in Chapter 6 of this Manual. In population census related ASGC editions, the Census Collection District level of this structure can be obtained from the separate Census Collection District listing, also in Chapter 6.

Urban Centre/Locality Structure

23. Each Urban Centre consists of either one particular non-rural CD or an aggregation of two or more contiguous non-rural CDs with the same Section of State code. Each bounded Locality consists of either one particular rural CD or an aggregation of two or more contiguous rural CDs with the same Section of State code. Urban Centres/Localities (UC/Ls) are defined only for those times at which a Census of Population and Housing is held and cannot be incorporated in the Main structure of the ASGC for the following reasons:

- (a) their boundaries are generally inconsistent with the boundaries of Statistical Local Areas and higher level Main structure spatial units; and
- (b) the total area covered by them relates only to a part of Australia, whereas the total area covered by the Main structure categories relates to the whole of Australia.

24. The complete Urban Centre/Locality structure of the ASGC can be depicted as follows:

In this structure, Census Collection Districts are confined to those which fall within Urban Centres and Localities and relate to them by aggregation and disaggregation.

25. This structure is only relevant at those times when a Census of Population and Housing is held and is therefore included in Chapter 6 of Edition 2.1. Listings of component Census Collection Districts of Urban Centres and Localities are available on microfiche.

Section of State Structure

26. Within each State/Territory each Section of State represents an aggregation of non-contiguous geographical areas with particular urban characteristics, with the rural balance constituting another Section of State. There is also a separate Section of State to designate the combined Off-Shore and Migratory category. Collectively, they cover all of Australia. Sections of State are defined only for those times at which a Census of Population and Housing is held and cannot be incorporated in the Main structure of the ASGC because they do not conform to or align with any of the broader spatial unit types in the Main structure.

27. The complete Section of State structure of the ASGC can be depicted as follows:

In this structure Census Collection Districts (CDs), which collectively cover all of Australia, add without gaps or overlaps, to Sections of State which, in turn, add to States/Territories. Because this structure is only relevant at those times when a Census of Population and Housing is held, it is included in the Census related ASGC, ie Edition 2.1. However the CD composition of Sections of State may be obtained from the CD Conversion List (Catalogue No. 2918.0) which is available on floppy disk and microfiche through Information Services in Central and State offices of the ABS.

CHAPTER 3 : THE SPATIAL UNITS OF THE CLASSIFICATION

The spatial unit types which have been incorporated in the ASGC and the criteria relevant to their delimitation are outlined in this chapter.

Census Collection District (CD)

2. The CD is the smallest spatial unit type in the ASGC. It has been designed for use in the Census of Population and Housing as the basic collection, coding, processing, tabulation and publication unit. Its use in other statistics is limited at present to the compilation and release of building approval statistics for selected user defined areas. CDs are defined for each population census and are current only at census time, ie at the effective date of the relevant census related ASGC edition.
3. The basic concept of a CD is that of a ten day field workload area for a census collector. It also serves as the smallest area building block in the ASGC for the aggregation of CD statistics to higher level ASGC spatial units.
4. In urban areas CDs average about 300 dwellings, while in rural areas the number of dwellings per CD reduces as population densities decrease. For the 1991 Census of Population and Housing 31,410 CDs were delimited throughout Australia. This figure included 9 CDs covering Australia's external territories of Cocos (Keeling) Islands and Christmas Island.
5. The criteria according to which CDs for the 1991 Census were delimited are as follows:
 - (a) CDs should be consistent with both the collector's workload requirements and their role as a useful spatial unit and building block capable of aggregation into broader level ASGC spatial units;
 - (b) the area and population delimited by a CD boundary must not be so great that one collector cannot deliver and collect census forms within about ten days;
 - (c) the chosen CD boundaries should, if possible, be readily identifiable on the ground, be defined in terms of permanent features, follow the centre of a road or river if these features are used and should delimit CDs which conform to existing and proposed land uses. The use of major roads as CD boundaries in rural areas should be avoided where possible, ie to minimise splitting of identifiable rural localities;
 - (d) CDs should conform where possible to existing/gazetted suburb boundaries. CDs must not cross SLA boundaries and, as a consequence, any other ASGC spatial unit boundary;
 - (e) CDs should not be designed in such a way as to make them confidential for publication of data. Accordingly, a CD should contain, where possible, at least 100 persons at the next census. (Any CD found at the next census to have less than 100 persons will be combined with another CD for output, ie publication purposes); and

(f) CDs in aggregate must cover the whole of Australia without omission or duplication.

6. More detailed rules and procedures for delimiting CDs are contained in the ABS Collection District Design and Geographical Data Base Update Manual.

Statistical Local Area (SLA)

7. The SLA is a Legal LGA based (or equivalent) spatial unit which serves as the smallest spatial unit for the coding, compilation and publication of economic, social and demographic statistics (other than those collected in population censuses). It is the key intermediate level spatial unit for the compilation and publication of population census statistics.

8. SLAs must consist of one or more Census Collection Districts at the time when CDs are current and must cover, in aggregate, the whole of Australia without gaps or overlaps. They are the largest spatial units of which the Legal LGAs, Statistical Subdivisions and Statistical Region Sectors are composed.

9. Within that part of Australia which is covered by incorporated Local Government Councils, SLAs are based on whole LGAs or parts thereof. Where an area is covered by an incorporated Community Government Council (which currently only occurs in the Northern Territory), it will be delimited as an SLA if it is of sufficient size and statistical significance. In the remainder of Australia, SLAs are unincorporated areas.

10. The criteria according to which SLAs are delimited are as follows:

(a) A Local Government Council Area is adopted as an SLA if it meets the following criteria:

(i) fits wholly within a Statistical Subdivision, and

(ii) is broadly similar in size, economic and statistical significance to equivalent Legal LGAs elsewhere in Australia.

(b) A Community Government Council Area is adopted as an SLA (and Legal LGA) if it meets the following criteria:

(i) is broadly similar in size and statistical significance to the other SLAs in the Northern Territory, and

(ii) there is a significant user need for separate statistics.

(c) A Legal LGA which does not satisfy the conditions in (a)(i) and/or (ii) above must, in general, be split into parts which do satisfy these conditions. Each such part must then be treated as an SLA. The circumstances in which Legal LGAs are split are:

(i) where the boundaries of one or more Statistical Subdivisions cut across a Legal LGA, the Legal LGA must be split into two or more parts — each corresponding to that which falls within the relevant Statistical Subdivision, and

(ii) where, on a consensus of subjective assessments, a particular Legal LGA is substantially different from other equivalent Legal LGAs in terms of size and economic significance or in terms of user needs for statistics, the Legal LGA can be split into

two or more parts — each corresponding to one or more suburbs in the case of predominantly urban LGAs. (The number of Legal LGAs split so far on this basis is small and includes the City of Brisbane as the major example.)

- (d) All unincorporated on-shore areas and off-shore islands within a Statistical Subdivision of an Australian State must be treated as one SLA unless a part of such an unincorporated area is considered economically significant. In these instances separate SLAs can be formed, eg for each unincorporated off-shore island (or designated group of unincorporated off-shore islands) which, on the basis of a consensus of subjective assessments, is considered to be economically significant. Each such SLA is included in the State or Territory which has jurisdiction over it (eg Lord Howe Island in NSW).
- (e) Oil rigs and other man-made platforms are formed into a set of seven 'off-shore' areas, one per State and the Northern Territory. Each State and Territory set of off-shore areas is then treated as a separate SLA of the relevant State or Territory.
- (f) In the Northern Territory the unincorporated area within each Statistical Subdivision is either adopted as a single SLA (eg as in the case of Daly) or split into two or more SLAs to separately distinguish an economically significant town (eg Nhulunbuy), island (eg Groote Eylandt) or administrative region. For the 1991 Census, the ASGC classified the major part of the Northern Territory as unincorporated. The incorporated part includes the areas covered by the Legal LGAs of Darwin, Alice Springs, Jabiru, Tennant Creek, Katherine, Litchfield and the Community Government Council of Coomalie. (Coomalie has been gazetted under the NT Local Government Act as a Community Government Council and satisfies the criteria to be accepted as an SLA within the ASGC.)
- (g) In the Australian Capital Territory, which is entirely unincorporated, each Statistical Subdivision within the 'Canberra Statistical Division' is split into two or more SLAs to separately distinguish each suburb, locality and predominantly non-urban ACT district (or balance thereof). Within the 'Australian Capital Territory — Balance Statistical Division', one SLA represents the remainder of the ACT.

Statistical Subdivision (SSD)

- 11. The SSD is the smaller of two statistical 'general purpose' regional type spatial units in the ASGC - the other is the Statistical Division.
- 12. SSDs must consist of one or more Statistical Local Areas (SLAs) and must cover, in aggregate, the whole of Australia without gaps or overlaps. They are the largest spatial units of which the Statistical Divisions and Statistical Districts are composed.
- 13. The criteria according to which SSDs are delimited are basically the same as for Statistical Divisions. This means that:
 - (a) SSDs which are mainly non-urban, ie outside State Capital City Statistical Divisions or outside Statistical Districts are, in general, delimited in accordance with the Statistical Division criteria in paragraphs 16 and 17 (b) ; and
 - (b) SSDs which are mainly urban, ie within State Capital City Statistical Divisions or within Statistical Districts, and represent dissections of these Divisions or Districts are,

in general, delimited only in accordance with the more broadly stated Statistical Division criteria in paragraph 16 below.

In addition, the following conditions apply:

- (i) each Statistical District that falls entirely within a State or Territory must consist of one or more whole SSDs,
- (ii) each Statistical District that straddles a State/Territory boundary must consist of one or more whole SSDs on either side of the boundary, and
- (iii) a Statistical Division which contains an SSD that is also a Statistical District (or part of a Statistical District) must have at least one other SSD constituting the remainder of the Statistical Division, even though that second SSD may not have a predominant town or cluster of towns that wields a unifying social and economic influence over the region.

Statistical Division (SD)

14. The SD is the larger of two statistical 'general purpose' regional type spatial units in the ASGC - the smaller one is the Statistical Subdivision (SSD).

15. SDs must consist of one or more Statistical Subdivisions and must cover, in aggregate, the whole of Australia without gaps or overlaps. They must not cross State or Territory boundaries and are the largest spatial units of which the Australian States, the Northern Territory and the Australian Capital Territory are composed. However, in 'Other Territories', Jervis Bay Territory and the Territories of Christmas Island and Cocos (Keeling) Islands, together form one Statistical Division.

16. The currently applicable basis for delimiting SDs was determined by the 31st and 33rd Conferences of Statisticians of Australia in 1969 and 1973. Resolution 2 of the 1973

Conference states:

- (a) that Statistical Divisions should ideally be delimited in all States on the basis of socio-economic criteria and should where possible embrace contiguous whole legal local government areas;
- (b) that the boundaries of the Statistical Divisions so delimited should be changed only at infrequent intervals, for example, at periods of 15 to 20 years; and
- (c) that, if practicable, such revisions in Statistical Division boundaries should be determined in time for use in the next Census of Population and Housing.

17. Elaborations of this general basis for delimiting SDs are supplied by the Resolutions of the 31st Conference of Statisticians (1969) which are mainly concerned with delimiting urban centres, and the guidelines incorporated in the ABS Collection District Design and Geographic Data Base Update Manual. These provide:

- (a) that delimitation of State Capital City SDs is to be based on Resolution 3 of the 31st Conference as subsequently amended by general agreement in 1975. This amended Resolution, which also applies to Statistical Districts, states:

that around each urban centre with a population of at least 25,000 a further boundary encompassing a Statistical District or Capital City Statistical Division, shall be defined after consultation with planners, to contain the anticipated development of the urban centre and associated smaller urban centres for a period of at least twenty years. It shall consist of whole local government areas if possible. Where suitable municipal, city or town boundaries contain the urban centre they may be used as Statistical District boundaries. This fixed boundary (as distinct from the urban boundary which is moving) will delimit an area which, for general statistical purposes, is free from the practical problems imposed by the moving boundary, but which nevertheless represents the city in a wider sense. This procedure cannot be applied to separate urban centres within Statistical Districts or within Capital City Statistical Divisions; and

- (b) that in delimiting other SDs, paragraph 16 above should be interpreted to mean that an SD should be a relatively homogeneous region characterised by identifiable social and economic links between the inhabitants and between the economic units within the region, under the unifying influence of one or more major towns or cities.

18. In accordance with the foregoing, Statistical Divisions have been delimited within the individual States and Territories as follows:

- (a) In NEW SOUTH WALES, proclaimed NSW Government Regions coincide with Statistical Divisions with one exception: the proclaimed NSW Government Region of North Coast consists of the SDs of Richmond-Tweed and Mid-North Coast. The boundaries of these Regions have been delimited on the basis that the degree of economic and social intercourse within each Region should be maximised. Statistical and other data used in delimiting the boundaries have included available information about transport patterns, the intensity of trunk telephone calls to and from major cities and towns, the pattern of retail shopping and the marketing of fresh goods, circulation areas of some provincial newspapers and coverage of principal radio stations.
- (b) In VICTORIA, the Statistical Divisions correspond with the State Planning Regions adopted by the Victorian Government in October 1981 except in the Port Phillip Region and, because of consequential effects, the Central Highlands and Loddon-Campaspe Regions. The Victorian Government's Port Phillip Region is comprised of the Melbourne Statistical Division, the Shires of Bass and Phillip Island, the remaining part of the Shire of Upper Yarra, the Borough of Wonthaggi and French Island all of which are in the Gippsland Statistical Division, and the Shires of Bacchus Marsh and Gisborne which are in the Central Highlands and Loddon-Campaspe Statistical Divisions respectively.

The Planning Regions are the largest units of a three tier system consisting of Regions, Subregions and Legal LGAs. Subregions, in all but exceptional cases, are aggregates of whole Legal LGAs, and Regions are always aggregates of Subregions. The boundaries of these Regions and Subregions have been delimited by taking account of the following:

- (i) comparisons with other ways of dividing the State, including the previous Central Planning Authority regions, and various areas used for the presentation of statistics,
- (ii) natural physical systems, such as climatic, river, geological, topographic and geographic systems.

- (iii) regional communication systems, and
 - (iv) various functional socio-economic factors such as patterns of travel, shopping and employment, newspaper circulation, regional zoning of sporting, social and community welfare organisations and library and hospital regions.
- (c) In QUEENSLAND, formal State Planning Regions have been abolished and SDs accord with the general considerations and criteria outlined in paragraphs 14 to 17 above. Nevertheless, they are also used on an informal basis for State Government planning purposes, where relevant.
- (d) In SOUTH AUSTRALIA, State Planning Regions, as proposed by the Committee on Uniform Regional Boundaries for Government Departments (CURB), were adopted by the South Australian Government in 1976. CURB Regions are based on two distinct, but complementary, sets of criteria. The first set is oriented towards defining the region as a structural entity on the basis of such factors as:
- population distribution, density and change,
 - production data,
 - dominant occupations in industrial and rural sectors,
 - socio-economic, ethnic and social factors, and
 - existing political boundaries (eg local government), etc.
- while the second set of criteria is oriented towards defining the region as a functional entity on the basis of the following type of factors:
- government department service areas,
 - newspaper circulation,
 - telephone traffic,
 - retail trading patterns, and
 - traffic flows, etc.

South Australian Statistical Divisions and Subdivisions are based on, but are not always congruent with, the CURB Regions. Even though the Statistical Divisions are not, in every case, identical with CURB Regions, in all cases they are directly convertible to these Regions. For instance, the Adelaide and Outer Adelaide Statistical Divisions comprise four CURB Regions, and statistical information for these four CURB Regions can be obtained by aggregating Statistical Subdivisions within the Adelaide and Outer Adelaide Statistical Divisions.

- (e) In WESTERN AUSTRALIA, State Planning Regions and Subregions, as proposed by the State Statistical Coordination Committee, were adopted by the Western Australian Government in January 1976. The Western Australian SDs and SSDs coincide with them. These Regions and Subregions have been devised in accordance with the following criteria:
 - (i) the Perth Metropolitan Region and the Subregions within it should be delimited in such a way that—
 - they are consistent with the overall concepts and planning details proposed in the Town Planning Department's 'Corridor Plan for Perth',
 - they must take cognizance of Legal LGAs, and
 - they should be built up from smaller units such as CDs; and
 - (ii) delimitation of the rural regions and subregions should take cognizance of:
 - the concept of 'community of economic and social interest',
 - the character of natural resources,
 - area dispersion of population and industry and the size of towns,
 - road and railway systems, and
 - production and marketing practices, etc.
- (f) In TASMANIA, the SDs accord with the general considerations and criteria outlined in paragraphs 14 to 17 above and are also considered to be satisfactory for the purpose of State Government planning.
- (g) In the NORTHERN TERRITORY, SDs are based on Territory Government Administrative Regions, and are consistent with the general considerations and criteria for their delimitation as described in paragraphs 14 to 17 above.
- (h) In the AUSTRALIAN CAPITAL TERRITORY, SDs accord with the general considerations and criteria for their delimitation as described in paragraphs 14 to 17 above.

- (i) In OTHER TERRITORIES, the SD has been delimited to represent the aggregated area of Jervis Bay Territory, and the Indian Ocean Territories of Christmas Island and Cocos (Keeling) Islands.

State/Territory (S/T)

19. The State/Territory is the largest type of spatial unit in the ASGC. There are six States and five Territories recognised in the ASGC as being within Australia, viz New South Wales, Victoria, Queensland, South Australia, Western Australia, Tasmania, Northern Territory, Australian Capital Territory, Jervis Bay Territory and the external Territories of Christmas Island and Cocos (Keeling) Islands. They are political entities with fixed boundaries and, with the exception of the last three mentioned territories, the total area of each (including their off-shore islands) is used for statistical purposes as a separate spatial unit in the ASGC. Jervis Bay Territory and the Territories of Christmas Island and Cocos (Keeling) Islands are included as one spatial unit at the S/T level, ie 'Other Territories'.

Statistical District (S Dist.)

20. In a broad sense Statistical Districts are the more important, predominantly urban areas of Australia which are not contained wholly within one Legal LGA or within a Capital City Statistical Division. There are at present 21 Statistical Districts in Australia and each is composed of one or more Statistical Subdivisions. Whilst the majority are contained wholly within one State/Territory, Statistical Districts can and, in three instances, actually do cross State/Territory boundaries.

21. The criteria for delimiting Statistical Districts are the same as for Capital City Statistical Divisions described in paragraph 17(a), but apply to population clusters (ie an urban centre, or two or more urban centres in close proximity) with a population of 25,000 or more. Like in the case of a State Capital City Statistical Division, the boundary of a Statistical District should contain the anticipated urban development of the centre for a period of at least twenty years and can cut across Legal LGAs which consist of urban and rural parts - see paragraph 31 below for urban centre criteria. A Statistical District may also be delimited in the case of an urban centre with less than 25,000 population where the ABS determines that there is a demand for intercensal population estimates for the area and that existing Legal LGA or SLA boundaries are obviously inadequate for this purpose.

Legal Local Government Area (Legal LGA)

22. The Legal Local Government Area is a type of spatial unit which represents the whole undivided geographical area of responsibility of either:

- an incorporated Local Government Council, or
- an incorporated Community Government Council (CGC) where the CGC is of sufficient size and statistical significance.

Currently only Coomalie in the Northern Territory has met the criteria in respect of CGCs. There are over 810 Legal LGAs in Australia which collectively cover only a part of Australia. (The major areas not covered by Legal LGAs are the large northern parts of South Australia, most of the Northern Territory and all of the Australian Capital Territory.)

23. The number of Legal LGAs and their boundaries vary over time. Their creation and delimitation is the responsibility of the respective State/Territory Governments and is governed by the provision of the Local Government Act within the particular State/Territory.

24. The various types of Legal LGAs in each State and the Northern Territory are:

- NEW SOUTH WALES: Cities*, Municipalities and Shires
- VICTORIA: Cities, Rural Cities, Towns, Boroughs and Shires
- QUEENSLAND: Cities, Towns and Shires
- SOUTH AUSTRALIA: Cities*, Municipalities and District Councils
- WESTERN AUSTRALIA: Cities, Towns and Shires
- TASMANIA: Cities* and Municipalities
- NORTHERN TERRITORY: Cities, Towns, Shires and CGCs.

(NOTE: * Municipalities proclaimed as Cities)

Statistical Region Sector (SRS)

25. Statistical Region Sectors cover, in aggregate, the whole of Australia without gaps or overlaps and consist of one or more SLAs although, in practice, most SRSs (ie all those outside Brisbane and Moreton SDs) can be expressed in terms of one or more adjoining SSDs. Further, most SRSs equate with Statistical Regions (SRs). Those SRSs which are subdivisions of SRs are used primarily for the production and presentation of selected population census and labour force statistics. Some of these SRSs are also used to present a wider range of statistics according to regional features, eg the Brisbane City rings and sectors, which could not be incorporated in ASGC Main structure spatial units.

Statistical Region (SR)

26. Statistical Regions consist of one or more SRSs and cover, in aggregate, the whole of Australia without gaps or overlaps. They were designed as sufficiently large regional type spatial units suitable for the presentation of population census statistics standard output. The minimum population size of such regions is approximately 147,000.

27. Statistical Regions are also used as the basis for the dissemination of regional labour force statistics. The minimum size of regions for this purpose however is dependent on Labour Force Survey sample sizes for each State. In New South Wales and Victoria the minimum population size is 250,000 although it is less in other States. It is therefore sometimes necessary in the dissemination of labour force statistics either to aggregate Statistical Regions into larger spatial units or to use subdivisions of Statistical Regions, ie SRSs.

Major Statistical Region (MSR)

28. Major Statistical Regions consist of one or more SRs and cover, in aggregate, the whole of Australia without gaps or overlaps. They do not cross State or Territory boundaries and serve the same purpose as Statistical Regions, though at a broader spatial level (ie Capital City SD versus Balance of State). However, in Tasmania, Northern Territory, Australian Capital Territory, and 'Other Territories', population size limitations mean that the State/Territory cannot be dissected into two MSRs. In these instances, the State/Territory each equates with one MSR.

Urban Centre/Locality (UC/L)

29. Broadly an Urban Centre is a population cluster of 1,000 or more people. A Locality is a population cluster of between 200 to 999 people. People living in Urban Centres are classified as urban for statistical purposes while those in Localities are classified as rural. Each Urban Centre and Locality is bounded (ie a boundary for it is clearly defined) and composed of one or more whole Census Collection Districts (CDs). UC/Ls are defined for each population census and are current only at census time.

30. The criteria for delimiting or bounding Urban Centres and Localities are based on those developed in 1965 by Dr G.J.R. Linge of the Australian National University. The criteria as currently in force, ie as adopted and subsequently amended by the Conference of Statisticians of Australia in 1965 and 1969 and the Review of ABS Statistical Geography of 1988, are set out below.

31. Each *URBAN CENTRE WITH A POPULATION OF 25,000 OR MORE* is to consist of a cluster of contiguous urban CDs and other urban areas. CDs and other areas classified as urban include the following:

- (a) All contiguous CDs which have a population density of 200 or more persons per square kilometre shall be classified as urban. Consequently State, Statistical Division, Legal LGA and other administrative boundaries shall be disregarded in determining whether a CD should be included within the urban centre.
- (b) A CD consisting mainly of land used for factories, airports, small sports areas, cemeteries, hostels, institutions, prisons, military camps or certain research stations shall be classified as urban if contiguous with CDs which are themselves urban.
- (c) Any CD which consists mainly of land used for large sporting areas, large parks, explosives handling and munitions areas, or holding yards associated with meatworks and abattoirs shall be classified as urban only if it is bordered on three sides by CDs which are themselves urban.
- (d) Any area which is completely surrounded by CDs which are urban must itself be classified as urban.
- (e) Where an Urban Centre of 25,000 or more population is separated from another urban area by a gap in actual development of less than three kilometres (by the shortest railway station or road distance), the gap shall be bridged by classifying a connecting CD as urban, and therefore treating the urban areas as one. If the gap is three or more kilometres (and whether or not it is comprised mainly of reserved land or a natural

barrier) the urban areas shall remain separate. (Dr Linge recommended that the outlying urban area should have a population of at least 1,000.)

- (f) Any area included in an urban centre in 1971 or thereafter under the provisions of these criteria shall continue to be so included, unless the population of the urban centre falls below 25,000, in which case these criteria will cease to apply.
- (g) If a CD was incorrectly included (for whatever reason) in a Linge area at a previous Census, then it should be excluded at the next Census unless it now meets the criteria.
- (h) Large peripheral CDs in growth areas shall be fragmented; and insofar as the availability of visible boundary features allows, the fragments so created shall be as near square-shaped as possible, contain at least 100 persons at the next Census and be of such a size that they will contain a collector's workload when fully developed. For the purpose of delimiting Urban Centres such fragments shall be regarded as CDs.

32. Each *URBAN CENTRE WITH A POPULATION OF BETWEEN 1,000 AND 24,999* is to be delimited as follows:

- (a) The Urban Centre shall be delimited subjectively (by the inspection of aerial photographs, by field inspection and/or by consideration of any other information that is available) - guidelines for this purpose are described in paragraph 36 below.
- (b) All contiguous urban growth is to be included (which, in small urban areas, would not necessarily occur if the density criterion was applied), together with any close but non-contiguous development which could be clearly regarded as part of the urban centre. However, cognizance shall be taken of the criteria outlined in paragraph 33 above particularly in urban centres which contain a population of between 20,000 and 24,999.

33. *LOCALITIES* are to be delimited as follows:

- (a) All population clusters of less than 1,000 population and whose population is expected to reach 200 by the next census are to be examined as regards the drawing of a boundary around the area encompassing the cluster.
- (b) The following criteria must be satisfied before a boundary is drawn around a Locality. It must:
 - contain a non-farm population of at least 200 people but not more than 999 by the next Census;
 - have a minimum of 40 occupied non-farm dwellings with a discernible urban street pattern; and
 - have a discernible nucleus of population.
- (c) If there is some doubt that a Locality will reach the minimum population of 200 people then a boundary should still be drawn around the Locality.

- (d) Where, in the case of defence camps, construction camps, etc it is anticipated that the cluster will not exist at two consecutive censuses, these camps should not be bounded.
- (e) The Localities shall be delimited subjectively, by the use of the latest available aerial photographs, by field inspection and/or by consideration of any other information that is available.

34. Guidelines for the drawing of subjectively determined Urban Centre and Locality boundaries are set out below:

- (a) Wide rather than narrow boundaries are to be used to ensure inclusion of urban or built up areas, ie it is preferable to include some rural rather than exclude some urban areas. However, this guideline should be interpreted in the light of those following below.
- (b) Continuity of urban development is the main criterion, ie boundaries are not to be thrown very wide just to include some small non-contiguous area or urban development. (The Linge criterion of 3 kilometres may be of assistance in this respect in larger Urban Centres of say greater than 10,000-15,000 population.)
- (c) Where the subjective boundaries decided upon are contained within a municipal boundary and the 'remainder' so left is small and/or of small population, the municipal boundary is to be used.
- (d) For previously bounded statistical cities, statistical towns or localities the boundaries are not to be changed lightly, ie comparability is to be maintained with the past unless there are significant exclusions (either due to faulty boundaries at the previous Census or subsequent development).
- (e) Cognizance is to be taken of 'approved plans' with regard to urban land usage.
- (f) Topographic boundaries must be used wherever possible where consistent with the above guidelines.

Section of State

35. Within a State or Territory each Section of State represents an aggregation of non-contiguous geographical areas of a particular urban type, with the rural balance constituting another Section of State. There is also a separate Section of State to designate the Migratory category. The Sections of State within each State and Territory are the following:

- (a) Major Urban : All urban centres with a population of 100,000 and over.
- (b) Other Urban : All urban centres with a population of 1,000 to 99,999.
- (c) Bounded Locality : All localities with a population of 200 to 999.
- (d) Rural Balance : The remainder of the State/Territory.
- (e) Migratory : Off-Shore Areas and Migratory.

They are defined for each population census and are current only at census time, ie at the effective date of the relevant census related ASGC edition.

36. Urban Centres which are bisected by a State/Territory boundary have each portion included in the relevant State's or Territory's Section of State.

Off-Shore Area and 'Migratory' Categories

37. Off-shore oil rigs, drilling platforms and the like are treated collectively within each State and the Northern Territory as an off-shore area which is, for population census purposes, combined with the respective State/Territory 'migratory' categories as explained below.

38. The 'migratory' categories relate only to the Census of Population and Housing where it is not possible to code every person to an ASGC spatial unit below State or Territory level. The persons that cannot be so coded are those enumerated on board vessels in and between Australian ports (ie in Shipping CDs), or on board long distance trains, buses or aircraft. Such persons are classified as migratory and attributed to a State or Territory.

39. For the 1991 Census of Population and Housing, Australian residents temporarily in Antarctica were within the scope of the Census and were included in the 'Migratory' category for Tasmania.

40. To facilitate the recording of migratory populations in the Census, the ASGC provides within each State and the Northern Territory a migratory category at the CD level, even though such a category is not a spatial unit in the conventional sense. This migratory CD is then combined with the off-shore area CDs to form one Statistical Local Area, Statistical Subdivision and Statistical Division within each State and the Northern Territory.

CHAPTER 4 : THE SPATIAL UNIT CODE SYSTEM

This chapter describes the system of nominal geocodes⁽¹⁾ which identify and represent ASGC spatial units.

2. The ASGC code system consists of several standard sets of numeric codes — one for each group of spatial units of a particular type, eg Australian States and Territories. The standard code sets are supplemented by a special purpose code set which is described in paragraphs 6-9 below.

Standard ASGC Codes

3. The codes in some standard sets can be used independently, eg the codes for Statistical Districts or States and Territories, while those in others need to be used in association with codes from other sets, eg SLA codes which need to be used together with State and Territory codes for unambiguous Australia-wide identification of SLAs.

4. The reasons for adopting such a system of codes were partly historical (to minimise the costs of conversion of pre-ASGC codes to ASGC codes) and partly practical (to minimise spatial unit code sizes and to provide flexibility of choice in presenting spatial unit hierarchies for statistical output purposes).

5. A separate standard ASGC code set exists for each of the following:

(a) Census Collection Districts (CDs)

The Census Collection District is the smallest geographical area used in the collection of Census data and is the area enumerated by one Census Collector. These are identified by a unique six digit code within each State and Territory. The first two digits identify Census Divisions (these closely follow Federal electoral boundaries), the next two digits identify Census Subdivisions (ie Census Field Group Leader Workload Areas) and the last two digits identify CDs within a Census Subdivision and are allocated sequentially from 01 within each Subdivision⁽²⁾. For complete Australia-wide identification the six digit code needs to be used in conjunction with the one digit State/Territory code.

(b) Statistical Local Areas (SLAs)

These are identified by unique four digit numeric codes within a State/Territory. They have the following features:

- (i) Within each State/Territory SLA codes are in the range 0001-9990 (excluding those ending with 99). (Codes ending with 99 and those within the range 9991-9999 have been reserved for special purposes.)

(1) Nominal geocodes, as distinct from positional geocodes, merely identify spatial units by one or more symbols, eg numeric or alphanumeric codes. Positional geocodes identify their actual location on maps.

(2) Census Subdivisions and Census Divisions are geographic regions used in the Census of Population and Housing field enumeration system. They are not part of the ASGC and differ completely from ASGC Statistical Subdivisions and Divisions.

(ii) The arrangement of SLA codes within each State/Territory is in ascending numerical order for alphabetically listed Legal LGAs/SLAs. Gaps have been provided between the codes of SLAs to provide space for future expansion or change.

(iii) The fourth, ie last, digit of the SLA code is used as an indicator for the following characteristics:

- 0 indicates that the SLA equates with a Legal LGA,
- 1-8 indicates that the SLA is a part of a Legal LGA, and
- 9 indicates that the SLA represents either an unincorporated area, an off-shore/migratory category or an undefined category.

For unique Australia-wide identification each SLA needs to be identified by its own four digit code plus the code of the relevant State/Territory.

(c) Statistical Subdivisions (SSDs)

These are identified by unique two digit numeric codes within Statistical Divisions. Gaps between codes of adjoining SSDs provide space for future expansion or change. The ordering of SSDs within Statistical Divisions follows traditional practice. For unique Australia-wide identification each SSD needs to be identified by its own two digit code plus the codes of the relevant Statistical Division and State/Territory.

(d) Statistical Divisions (SDs)

These are identified by unique two digit numeric codes within States/Territories. Gaps between codes of adjoining SDs provide space for future expansion or change. The ordering of SDs within States/Territories follows traditional practice. For unique Australia-wide identification each SD needs to be identified by its own two digit code plus the code of the relevant State/Territory.

(e) States/Territories (S/Ts)

These are identified by unique one digit numeric codes within Australia.

(f) Urban Centres/Localities (UC/Ls)

These are identified by unique five digit numeric codes within States/Territories. The arrangement of UC/L codes within each State/Territory is in ascending numerical order for alphabetically listed UC/Ls. In allocating codes to UC/Ls, gaps have been provided to allow space for future expansion or change. For unique Australia-wide identification each UC/L needs to be identified by its own five digit code plus the code of the relevant State/Territory.

(g) Statistical Districts (S Dists)

These are identified by unique four digit numeric codes within Australia. The first two digits indicate the State, Territory or States within which the Statistical District falls. The majority of the Statistical Districts are contained wholly within one State/Territory (S/T) and this is indicated by a zero (0) as the second digit, with the first digit indicating the State or Territory. In cases where Statistical Districts cross S/T

boundaries, the first digit indicates the major S/T and the second digit the minor S/T. The last two digits have been allocated in ascending numerical order to traditionally arranged Statistical Districts with gaps between codes to provide for future expansion or change.

(h) Legal Local Government Areas (Legal LGAs)

These are identified by unique four digit numeric codes within States/Territories. The Legal LGA codes were determined in conjunction with SLA codes and are strongly integrated with them. They have the following features:

- (i) they are identical with SLA codes in all cases where there is a strict one to one correspondence between Legal LGAs and SLAs; and
- (ii) their first three digits are identical with the first three digits of SLA codes in almost all those cases where Legal LGAs consist of two or three SLAs.

The incorporation of the Legal LGA code in the SLA code as described above permits almost all SLAs to be linked with their respective Legal LGAs. The only exceptions occur in Queensland and the Northern Territory in the case of the following Legal LGAs:

QLD: Albert, Brisbane, Logan, Pine Rivers, Redland, Caboolture, Gold Coast, Moreton, Thuringowa and Townsville; and

NT: Darwin and Palmerston.

In these 12 cases the number of component SLAs of each of the Legal LGAs is too large for their codes to incorporate the links. However, the link can still be provided by reference to the Legal LGA structure in Chapter 6.

For unique Australia-wide identification each Legal LGA needs to be identified by its own four digit code plus the code of the relevant State/Territory.

(i) Sections of State

These are identified by unique one digit numeric codes within States/Territories and need, for Australia-wide identification, to be associated with the code of the relevant State/Territory.

Special Purpose ASGC Codes

6. For certain statistical operations it is necessary to make provisions for the geographical classification of statistical information in cases where only incomplete location information is available. For example, a particular Population Census Schedule might provide insufficient location information to enable other information collected on the Schedule to be coded to an SLA or even a Statistical Subdivision. This usually occurs as a result of questions relating to usual residence 1 year ago and 5 years ago. There are many instances in such cases where only the Capital City or State name is given. Another example occurs within the Crime and Justice Statistics in the case of people with 'no fixed address' or 'no fixed abode'. To enable such vaguely specified information to be coded within the Main structure of the ASGC a

system of special undefined spatial categories and codes has been devised for input processing purposes.

7. In this system the two digit codes of 88 (in the case of SSDs and SDs) and 98 (in the case of SRs) and unique four digit SLA codes within States/Territories ending in 99 designate the undefined categories which are intended for the following uses:

- (a) Information required to be coded at the SLA level but only codable at SSD level should be coded to the undefined SLA within the defined SSD.
- (b) Information required to be coded at the SLA level but only codable at SD level should be coded to the undefined SLA of the undefined SSD within the defined SD.
- (c) Information required to be coded at the SLA level but only codable at the State/Territory level should be coded to the undefined SLA (9899) of the undefined SSD in the undefined SD within the defined State/Territory.
- (d) Information required to be coded at the SLA level but only codable at the Australia level should be coded to the undefined SLA (9099) of the undefined SSD in the undefined SD of the undefined State in Australia. The undefined State is designated by the code 0. This is applicable in cases where usual residence information is *not stated*.
- (e) An SLA code of 9199 is to be used in 'usual residence' and similarly worded coding where the information is *not applicable* (eg children who were not alive 5 years ago).
- (f) An SLA code of 9299 is to be used in 'usual residence' and similarly worded coding where the information relates to overseas.
- (g) An additional code of 9399 is to be used to represent the aggregation of the 'unincorporated' SLAs for each State and the Northern Territory. It is to be used as a defacto Legal LGA to enable State/Territory totals to be produced for some Population Census Legal LGA output.
- (h) An SLA code of 9499 is to be used to designate 'no fixed place of abode' for use in children in care, prison and other social statistics.

AUSTRALIAN STANDARD GEOGRAPHICAL CLASSIFICATION

8. The undefined spatial unit codes within the Statistical Division of Sydney are as follows:

<i>ASGC Code</i>				
<i>S</i>	<i>SD</i>	<i>SSD</i>	<i>SLA</i>	<i>ASGC Spatial unit name</i>
1				New South Wales
	05			Sydney
		05	0199	Inner Sydney Inner Sydney Undefined
		10	0399	Eastern Suburbs Eastern Suburbs Undefined
		15	0599	St George-Sutherland St George-Sutherland Undefined
		20	0799	Canterbury-Bankstown Canterbury-Bankstown Undefined
		25	0999	Fairfield-Liverpool Fairfield-Liverpool Undefined
		30	1199	Outer South Western Sydney Outer South Western Sydney Undefined
		35	1399	Inner Western Sydney Inner Western Sydney Undefined
		40	1599	Central Western Sydney Central Western Sydney Undefined
		45	1799	Outer Western Sydney Outer Western Sydney Undefined
		50	1999	Blacktown-Baulkham Hills Blacktown-Baulkham Hills Undefined
		55	2199	Lower Northern Sydney Lower Northern Sydney Undefined
		60	2399	Hornsby-Ku-ring-gai Hornsby-Ku-ring-gai Undefined
		65	2599	Northern Beaches Northern Beaches Undefined
		70	2799	Gosford-Wyong Gosford-Wyong Undefined

NOTE: (i) The first two digits of the undefined SLA code are normally in the range 00 to 89 (usually with a gap of 1) in Main ASGC structure order with the last two digits always being 99; and

(ii) The undefined SLA code for each Capital City is 0099.

AUSTRALIAN STANDARD GEOGRAPHICAL CLASSIFICATION

In addition the undefined Statistical Division for each State/Territory is:

S/T	SD	SSD	SLA	
1	88	88	9899	NSW UNDEFINED
2	88	88	9899	VIC UNDEFINED
3	88	88	9899	QLD UNDEFINED
4	88	88	9899	SA UNDEFINED
5	88	88	9899	WA UNDEFINED
6	88	88	9899	TAS UNDEFINED
7	88	88	9899	NT UNDEFINED
8	88	88	9899	ACT UNDEFINED
9	88	88	9899	OTHER TERRITORIES UNDEFINED

while the undefined State/Territory would be designated by S/T code 0 as follows:

S/T	SD	SSD	SLA	
0	88	88	9099	STATE/TERRITORY UNDEFINED (ie Australia) or for Population Census purposes NOT STATED
0-9	88	88	9199	NOT APPLICABLE
0-9	88	88	9299	OVERSEAS
0-9	88	88	9399	DEFACTO LEGAL LGA for Population Census purposes
0-9	88	88	9499	NO FIXED PLACE OF ABODE

The undefined Statistical Region would be designated as follows:

S/T	SR	SLA	
1-5	98	0099	CAPITAL CITY UNDEFINED
6-8	04	0099	
1-5	98	9899	STATE/TERRITORY UNDEFINED
6-9	04	9899	

9. Codes 00000 and 99999 prefixed by the relevant State/Territory codes are used by Population Census to designate Rural Balance and Off-Shore and Migratory categories respectively in the recording of Urban Centres/Localities.

Spatial Unit Code Changes between ASGC Editions

10. The main causes of spatial unit code changes between ASGC editions are:

- (a) spatial unit name changes — especially in the case of Legal LGAs and SLAs,
- (b) some spatial unit area changes — eg where one spatial unit is split into two or more new ones,
- (c) consequential changes — ie where one change forces another, and
- (d) general code structure revisions.

11. Because not all code changes reflect real spatial unit changes and because not all spatial unit changes are reflected by code changes it is not possible to rely on codes alone to precisely identify spatial units. It is therefore important to always quote (in publications or tabulations) the particular ASGC edition as well as the codes and names of the spatial units according to which statistics are compiled, disseminated or published.

CHAPTER 5 : MAINTENANCE OF THE CLASSIFICATION AND ITS USE IN PUBLICATIONS

Maintenance of the ASGC Manual

The ASGC Manual has been kept up-to-date by the issue of replacement pages — generally once a year. The original ASGC effective from 5 July 1984 was Edition 1. Each issue of replacement pages formed a new edition of the Manual, ie Edition 2, Edition 3 and so on with Edition 9 being the last edition to be produced in that series.

2. The revised ASGC effective 1 January 1991 contained delimitation criteria and spatial units for the 1991 Census of Population and Housing. It formed the base copy which is now being updated through the provision of replacement pages. A new numbering system was introduced with the revised ASGC becoming Edition 2.1. The replacement pages relative to this revised ASGC will form Editions 2.2, 2.3 and so on.

3. The spatial unit and other changes for which the ASGC Manual is updated are essentially of two kinds:

- (a) Externally controlled spatial unit changes. These changes relate to administrative or political areas which have been adopted as spatial units in the ASGC. The ABS has no influence or control over changes to such spatial units which have to be made to the ASGC Manual virtually as they occur. The most usual changes of this type are changes to Legal LGAs which are determined by the Local and State/Territory Governments involved. These changes can range from Legal LGA boundary variations to the creation or amalgamation of whole Legal LGAs and usually require consequential changes to related ASGC spatial units such as SLAs.
- (b) All other changes. These cover changes to statistical type spatial units, such as Census Collection Districts and Statistical Districts, to the principles and criteria which govern their delimitation, and to all the explanatory and other material in the ASGC Manual. Although changes of this type are, on occasions, triggered by changes to administrative or political areas described in (a) above, they usually flow from ad hoc or systematic reviews and tend to be implemented in the ASGC Manual in time for particular statistical collections such as the Census of Population and Housing or the Retail Census.

Maintenance of ASGC Related Material

4. The ASGC Manual presents the classification primarily as a statistical standard according to which spatially (ie geographically) classified statistics are to be produced. For purposes of applying the ASGC in statistical work additional and more specialised ASGC related material is needed which has to be maintained in accordance with the ASGC. Some of the more important types of this material are briefly described below.

ASGC Output Selectors

5. Output selectors enable extraction of a variety of classification subsets from particular classifications. The classification subsets obtained by processing output selectors conform in all respects with the standard ASGC structures from which they are derived and may in some cases incorporate combinations of ASGC categories and allow for the provision of

statistical totals. These output selectors are used primarily for creating stubs in statistical tabulations and tables.

6. ASGC output selectors are stored in the ABS Classification System and are updated with each edition of the ASGC. Selectors are accessible to authorised users of that system. Examples of the ASGC structures which can be identified on the ABS Classification System by their classification name or output selector name are listed below.

<i>DD Classification name</i>	<i>Output selector name</i>
ASGC-DETAILED-MAIN-STRUCTURE	CGC-STATES-OF-AUSTRALIA-MY CGC-STAT-DIVISIONS-MY CGC-STAT-SUBDIVISIONS-MY CGC-STAT-LOCAL-AREAS-MY
ASGC-STAT-DISTRICT-STRUCTURE	CGC-STAT-DISTRICTS-MY CGC-STAT-DIST-SUBDIV-MY CGC-STAT-DIST-SLAS-MY
ALPHA-LIST-OF-LGA-SLA-BY-STATE	CGC-ALPHA-ORDER-AUST-MY CGC-LOCAL-GOVT-AREAS-MY CGC-ALPHA-LIST-BY-STATE-MY
ASGC-DETAILED-REGION-STRUCTURE	CGC-STATES-MY CGC-MAJOR-STAT-REGIONS-MY CGC-STATISTICAL-REGIONS-MY CGC-STAT-REGION-SECTORS-MY CGC-SLA-IN-STAT-REGIONS-MY

'M' indicates the month and 'Y' the year of the effective version. The complete list of classifications and output selectors maintained by Classification and Geography Section is shown in Appendix 3.

7. The ABS Classification System is a generalised software facility on the mainframe computer which is designed to store classification data such as the ASGC. Once a classification is on the system it can be used in a variety of ways, by many different ABS project groups. The system allows, for example, the selection of a subset of a standard classification, selection and formatting of labels, automatic totalling at the various hierarchic levels of the classification and the choice of ordering for the labels.

8. As all ASGC structures are now on the Classification System, authorised users of the system are encouraged to create their own subsets of the ASGC structures for their specialised needs using their own output selectors.

9. A 'time stamping' facility on the ABS Classification System further enhances classification maintenance by recording for each individual ASGC spatial unit the period during which it is operative in terms of a starting and finishing date. This facility enables ASGC subsets and full ASGC structures to be identified and/or produced for any given date and ASGC spatial unit changes over any specified period, eg between two different operative versions of the ASGC, to be identified and listed. Any publication containing statistics classified in accordance with a particular version of the ASGC could specify that particular version in terms of its operative date and list the spatial unit changes which have taken place between that version of the ASGC and any other.

10. Original ASGC spatial unit records carry, as the starting date of their operative period, the ASGC introduction date, ie 5 July 1984 (840705) and 31 December 1999 (991231) as the ending date of their operative period. When changes to ASGC spatial unit records are made, the superseded record will have the ending date brought forward to the day before the effective date of the new record as printed on the ASGC replacement pages. For Edition 2 of the ASGC Manual, changes were effective from 29 July 1985. This was the date for conversion to ASGC codes of the ABS Business Register from which a large number of ABS collections select their framework. The effective date for the 3rd (1986 Census of Population and Housing) edition was 1 January 1986, while for the 1991 Census edition of the ASGC the effective date was 1 January 1991. Listings of effective and/or implementation dates are referenced in Appendixes 1 and 2 of this and previous editions.

Area Coding Reference Data (including the National Localities Index (NLI))

11. Area coding reference data consist essentially of localities and streets/localities tables or indexes which specify the appropriate spatial unit code or codes for each locality and, where necessary, for street addresses within localities.

12. The ABS has in the last few years developed the National Localities Index (NLI) which lists all localities in Australia. 'Locality', for the purpose of the NLI, is defined as a place where people do, or may possibly, reside or conduct a business. The localities are each designated a postcode and their full ASGC code (ie State/Territory, Statistical Division, Statistical Subdivision and Statistical Local Area). The NLI is augmented by a streets index that allows any address to be coded to an SLA where the locality is split between two or more SLAs.

13. Area coding reference data can also cover various keys and conversion tables which specify for one set of spatial unit codes (eg SLA codes) the codes of related spatial units (eg of Statistical Districts) to facilitate data conversion in cases where only one spatial unit code has been assigned to the data.

14. The localities and streets/localities tables and indexes are needed for the purpose of determining and assigning spatial unit codes for addresses and are nowadays held mainly on computer media for accessing in automatic coding operations or for producing manuscripts for printing of hard copy indexes used in manual coding processes.

Maps

15. Maps depicting spatial unit boundaries and other features are needed generally for the following purposes:

- (a) precise delimitation of spatial units, eg for precise specification of area coding reference data or for use by field staff in collecting statistical information;
- (b) collection and geographic coding of Census of Population and Housing data. The maps used for this purpose are referred to as Census Field Maps and depict Census Collection Districts which are updated for each Census; and
- (c) presentation of statistical information. For this purpose a wide variety of maps are produced and published. The maps either accompany statistical tables or incorporate statistical information as map features eg social atlases.

Geographic Base Files and Similar Data Stores and Systems

16. There are computer files and systems which incorporate spatial unit information for use in automated statistical processing. The largest of these is the Geographic Data Base (GDB) which was developed for the 1986 Census of Population and Housing and enhanced for the 1991 Census. It incorporates most of the ASGC spatial unit specifications (such as their codes, hierarchic links and, in the case of the CDs, their digitised boundary points) as well as those of other spatial units for which Census output is produced (such as electoral districts). It also has the capacity to store user defined spatial units.

Coordination of ASGC Maintenance

17. Maintenance of ASGC related material is shared by a number of projects within ABS Central and State Offices. It is coordinated by Classification and Geography Section which also has responsibility for maintaining the ASGC Manual and the ASGC output selectors on the ABS Classification System, as well as providing assistance to users.

18. Examples of major ASGC and related maintenance functions, handled outside Classification and Geography Section or shared with it, include the following:

- (a) delimitation of CDs, urban centres and other Population Census specific spatial units in accordance with ASGC criteria and the specification of Population Census maps — these tasks are carried out in ABS Central and State Offices and are the responsibility of Population Census Branch;
- (b) maintenance of area coding reference data on the ABS Business Register — this task is carried out in ABS Central and State Offices and is the responsibility of the Business Register Section; and
- (c) conduct of spatial unit reviews and preparation of proposals to vary existing statistical type spatial units and/or spatial unit criteria — these tasks are undertaken, in most cases, by ABS State Office projects concerned with the provision of geographically classified statistics. Under existing coordination arrangements the results of all such work flow to Classification and Geography Section for assessment (in conjunction with other ASGC users) and coordinated implementation.

Use of the ASGC in Publication of Statistics

19. The ASGC has been constructed to enable spatially classified statistics to be produced on a spatially comparable basis. Production and publication of spatially comparable statistics requires that the ASGC be consistently applied in statistical work.

20. Accordingly it is recommended that in publishing statistics according to the ASGC:

AUSTRALIAN STANDARD GEOGRAPHICAL CLASSIFICATION

- (a) where possible each table should relate to one particular ASGC structure only, which should ideally be presented in full and be identified in the table heading or a table footnote;
- (b) ASGC spatial unit names should be shown in table stubs or column headings and should conform with those in the ASGC or authorised ASGC subsets;
- (c) omission of one or more hierarchic levels in a particular ASGC structure is permitted (eg omission of the entire CD level and/or the entire SSD level within the Main structure of the ASGC) provided the omissions are noted and explained in the publication;
- (d) ASGC spatial units can be combined (eg where statistics for one or more of them are confidential) provided the combinations are confined to spatial units which are:
 - within one ASGC structure,
 - at one hierarchic level, and
 - within the spatial unit at the next hierarchic level to which they are directly related;for example, two or more SLAs within an SSD or two or more SSDs within an SD in the Main structure of the ASGC;
- (e) where statistics are required for spatial units from two different ASGC structures, eg Legal LGAs and SDs, it is permissible, in certain circumstances, to publish the statistics in one table using a cross-classification of the spatial units. Care should be taken to ensure that the spatial units being cross-classified cover the same total area. For example, in some States and the Northern Territory Legal LGAs cover only part of the S/T (the remainder of the S/T being unincorporated), while SDs cover the whole of the S/T. A cross-classification of LGAs within SDs would be inappropriate in these circumstances if a S/T total were required. In this case the Detailed Main structure or the Detailed Statistical Region structure would be more appropriate; and
- (f) each file, document or publication containing statistics classified according to the ASGC should specify the applicable ASGC edition.

21. There may, of course, be circumstances where it is not possible to conform with these recommendations. In these cases application of the recommendations may be relaxed with Classification and Geography Section agreement.

ASGC Related Products

22. Classification and Geography Section have developed additional products which users of the ASGC may find helpful. These products, which are available on floppy disk, are listed below.

- *Conversion Listing : Census 86 SLA Codes/Census 91 SLA Codes*

A concordance incorporating all area/code changes to SLAs between the 1986 and 1991 Censuses of Population and Housing.

- *Listing of Australian Standard Geographical Classification (ASGC) Labels and Codes*

These listings are available for all structures and all editions of the ASGC.

- *National Localities Index (NLI)*

This Index has been designed as a comprehensive general purpose coding aid for assigning postcodes and ASGC codes (ie S/T, SD, SSD and SLA) to addresses and/or localities within Australia.

For NLI purposes the definition of 'locality' is intentionally broad to ensure that the Index is comprehensive. A 'locality' has therefore been defined as a place where people do, or may possibly, reside or conduct a business.

This Index is available by State and Territory or for the whole of Australia. It can be supplied with or without street data. Street data is necessary if there is a requirement to code all addresses, including those in localities that are split between two or more SLAs. The effective date of the first version of the NLI is 1 January 1991 and it is being updated regularly in line with ASGC editions.

- *Customised Concordances*

Concordances between ASGC spatial units, postcodes and other geographical units can be tailored to the individual user's special requirements.

For further information on any of these products you should contact the Assistant Director, Area Classification, Australian Bureau of Statistics, Canberra — telephone (06) 252 5888 or facsimile (06) 252 7788.

CHAPTER 6 : THE CLASSIFICATION

Summary

This chapter presents the current ASGC structures in their full detail.

2. The currently applicable ASGC structures presented in this chapter are:

- MAIN STRUCTURE. This is presented in two versions:
 - BROAD MAIN STRUCTURE (ie down to the SSD level)
 - DETAILED MAIN STRUCTURE (ie down to the SLA level).
- STATISTICAL DISTRICT STRUCTURE.
- LEGAL LGA STRUCTURE.

In this structure, which is more commonly referred to as the ALPHABETIC LIST OF LEGAL LGAs AND STATISTICAL LOCAL AREAS WITHIN STATES/TERRITORIES, Legal LGAs are ordered alphabetically within States/Territories, and Statistical Local Areas (SLAs) are ordered alphabetically within Legal LGAs.

- STATISTICAL REGION STRUCTURE. This is presented in two versions:
 - BROAD STATISTICAL REGION STRUCTURE (ie down to the SR level)
 - DETAILED STATISTICAL REGION STRUCTURE (ie down to the SLA level).

Number of ASGC Spatial Units

3. The number of ASGC spatial units (ie categories) in these structures as at 1 July 1993 is set out below.

<i>Spatial unit</i>	NSW	VIC	QLD	SA	WA	TAS	NT	ACT	OT	AUST
States/Territories	1	1	1	1	1	1	1	1	1	9
Statistical Divisions	13	12	12	8	10	5	3	2	1	66
Statistical Subdivisions	43	50	30	21	26	9	11	7	1	198
Statistical Local Areas	188	238	428	131	147	44	59	103	3	1,341
Legal LGAs	177	210	134	119	139	29	8	—	—	816
Statistical Districts(a)	4	6	8	—	—	2	—	1	—	21
Major Statistical Regions	2	2	2	2	2	1	1	1	1	14
Statistical Regions	23	14	11	6	7	1	1	1	1	65
Statistical Region Sectors	25	14	30	6	7	3	2	2	1	90
